                      Submitted (19.NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Nov 19, 2002 this sequence version replaced gi:23813077.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bem.tmc.edu/projecte/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Submitted (08-APR-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NOTE: Estimated insert size may differ from sequence length
(see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently
consists of 4 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence
as soon as it is available and the accession number will
end_sequence:BZ134038"

| Exon/Intron boundaries of identified genes were chosen if there were canonical splice junctions that maintained sequence continuity across the splice junctions. Location/Qualifiers 1. 194985 /organism="Mus musculus" /mol type="genomic DNA" /db xref="taxon:10090" /chromosome="x" /clone="B178A13" /rpt family="MSTD" /rpt family="MSTD" /rpt family="G561. 1868) /rpt family="B1AM" /rpt family="B4A" | Baylor Plaza, Houston, TX 77030, USA On Mar 23, 1998 this sequence version replaced gi:2909685. Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality does not meet this standard, it will be indicated in the annotation. The repeat regions shown were identified using RepeatMasker by Adrian Smit. Sequence similarities were identified using Powerblast by Jinghui Shang. | Garcia, C., Goodman, M., Gorrell, J.H., Haywood, M., Jackson, L., Jin, S., Kampal, R., Karpathy, S., Leal, B., Li, Y., Liu, W., Logan, O., Lu, J., Ly, T., Martinez, C., Oswal, G., Perez, L., Rashid, N.D., Rowland, K., Savage, L., Scherer, S.S., Shen, H., Timms, K.M., Todd, J., Vo, Q., Worley, K.C., Yu, W., Chinault, C., Nelson, D. and Gibbs, R.A. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; SW:, SWISSPROT; Tr:, TREMBL; Wp:, WORMERP; Information on the WORMERP; Calebra (1997) and the content of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Submitted (19-SBP-2002) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 1SA, UK. and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may sized gaps filled with Ns to the estimated size and be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature

(see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft_data.h
NOTE: This is a "working draft' sequence. It currently
consists of 2 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence

```

```
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature
```

```
NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Center project name: GSGF

Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to confirm this sequence. Sequence data from the whole genome shotgun alone has only been used where it has a phred quality of at least 30.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Assembly program: XGAP4; version 4.5

It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         as soon as it is available and the accession number will be preserved.

On May 13, 2003 this sequence version replaced gi:23664762.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Submitted (23-JAN-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Wright,D., Wright,R., Wu,J., Yakub,S., Yen,J., Yoon,L., Yoon,V., Yu,F., Zhang,J., Zhou,J., Zhou,X., Zhao,S., Dunn,D., von Niederhausern,A., Weiser,R., Smith,D.R., Holt,R.A., Smith,H.O., Weinstock,G. and Gibbs,R.A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (bases 1 to 226790)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.

A genomic DNA sequence (AAT66461) from Rhodothermus marinus (Rma) contains the gene for a thermophilic alkaline phosphatase (AP) and flanking regions. It was obtd. by transforming E. coli XL2-Blue MRP' cells with Rma genomic DNA fragments, screening for AP activity on plates contg. a chromogenic indicator, and KpnI digestion of isolated clone pBRM1. A 1.8 kb fragment of pBRM1/KpnI was subcloned into pUCl3 to to yield plasmid pCRM1.8 (AAT66462), and a presumptive full-length coding sequence (AAT66463) for Rma AP (AAM17830) was produced. The Rma AP nucleic acids can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A genomic DNA sequence (AAT66463) from Rhodothermus marinus (Rma) codes for a thermophilic alkaline phosphatase (AP) (AAW17830) that shows optimal activity at pH 10.8 and which is stable to heating at 65 deg for 1 hr. The sequence was deduced from a clone isolated following expression screening of E. coli cells transformed with Rma genomic DNA (see also AAT66461). The Rma AP gene can be used to produce recombinant AP in transformed host cells for use in nucleic acid and protein detection assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Thermostable Rhodothermus marinus alkaline phosphatase - useful as enzyme label in immunoassays and nucleic acid assays
                                                                                                                                                                    enzyme
                                                                                                                                                                                                                                            Davis
                                                                                                                                                                                                                                                                                                                27-OCT-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Best Local Similarity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                          Plasmid pCRM1.8 (AAT66463) contains a 1.8 kb HindIII/KpnI segment of genomic DNA (see also AAT66461) containing the alkaline phosphatase (AP) and flanking sequences from Rhodothermus marinus (Rma), cloned into pUC19. This recombinant plasmid has been used to produce Rma thermophilic AP in B. coli JM109 transformants. A presumptive full-length coding sequence (AAT66463) for Rma AP (AAW17830) was deduced. The Rma AP nucleic acids can be used for prodn. of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                prodn. of recombinant AP
detection assays.

                                                                                                                                                                                                                                                                                            sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the printed supports.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nakagawa

                                                                                                                                                                                                                                                                                    The present invention describes substantially purified human proteins CC (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 cl nthe specification). ABN15762 to ABN27252 encode the human ORFX CC proteins given in ABP00010 to ABN15705. CRICK proteins are useful for treating or preventing a pathology associated with an ORFX-associated CC disorder in humans, and in the manufacture of a medicament for treating a cyphorome associated with ORFX-associated disorder. ORFX proteins are useful for treating a cyphorome associated with ORFX-associated control of cancer, hyperproliferative disorders, cirrhosis of liver, cypsoriasis, benign tumours, keloid, degenerative disorders related to organ cransplantation, cardiovascular diseases, disorders related to organ cransplantation, cardiovascular diseases, disorders related to organ control of the control o

                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to gene sequences (ABI99915-ABI99934) having modified expression in fetal heart tissue as compared to adult heart tissue and the encoded proteins (ABB57375-ABB57392). The genes have cardiant activity and may be useful in the promotion of the repair of damage to heart tissue caused by myocardial necrosis. The gene sequences are useful for screening potential compounds for the ability to influence disease associated with myocardial necrosis. Drugs identified by the screening methods may be used to treat and prevent disease with which myocardial necrosis is associated, such as cardiac hypertrophy and cardiac insufficiency. Diagnosis of diseases such as those above is also is associated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful for screening caused by myocardial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   relates to a novel method for killing cancer cells, comprising causing an accumulation of activated Bcr-Abl in the nucleus, to induce apoptosis. The method has cyrostatic and immunosuppressive activity. The method is useful for killing cancer cells, and in the treatment of cancers including leukaemia. The invention also supplies a method useful

The invention relates to a novel method for killing cancer cells, comprising causing an accumulation of activated Bcr-Abl in the nucleus, to induce apoptosis. The method has cytostatic and immunosuppressive activity. The method is useful for killing cancer cells, and in the treatment of cancers including leukaemia. The invention also supplies a method useful for purging bone marrow to allow for orthologous bone marrow transplantation, and as a therapeutic option for chronic myelogenous

                  This sequence represents the human neuregulin-1 associated gene 1 (NRG1AG1) of the invention. The NRG1AG1 gene is also referred to as the human Schizophrenia gene. The invention also relates to fragments or variants of the gene and the NRG1AG1 polypeptides they encode. The NRG1AG1 nucleic acids and polypeptides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate NRG1AG1 expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of NRG1AG1 by expressing inactive proteins or to supplement the patients own production of NRG1AG1. Additionally, the gene may be used to produce NRG1AG1 and income that of the patients own production of the patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       P-PSDB; AAG67900, AAG67901, AAG67902, AAG67903, AAG67904, AAG67905, AAG679906, AAG67907, AAG67908, AAG67909, AAG67910, AAG67911, AAG67912, AAG67913, AAG67914, AAG67915, AAG67915, AAG67915, AAG67919, AAG67919, AAG67920, AAG67921, AAG67922, AAG67923, AAG67924, AAG67925, AAG67926, AAG67927, AAG67928, AAG67929, AAG67927, AAG67928, AAG67929, AAG67931, AAG67931, AAG67932, AAG67933, AAG67934, AAG67935, AAG67936, AAG67937.

This sequence represents the human neuregulin 1 gene of the invention. The invention also relates to fragments or variants of the neuregulin 1 gene. The gene and its proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate neuregulin 1 expression, such as schizophrenia. For example they may be used to treat disorders associated with decreased neuregulin 1 expression by rectifying mutations or deletions in a patient's genome that affect the activity of neuregulin 1 by expressing inactive proteins or to supplement the patients own production of polypeptides. Additionally, the gene may be used to produce the neuregulin 1 protein, by inserting the nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            culturing the cell to express the protein. The gene may also be used as DNA probes and primers in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The NRGIAGI polypeptides may also be used as antigens in the production of antibodies against NRGIAGI and in assays to identify modulators of NRGIAGI expression and activity. Anti-NRGIAGI antibodies and antagonists may also be used as diagnostic agents for detecting the presence of NRGIAGI polypeptides in samples. NRGIAGI is associated with schizophrenia which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAG67944, AAG67945, AAG67946, AAG67947, AAG67948, AAG67949, AAG67950, AAG67951, AAG67952, AAG67953, AAG67954, AAG67955, AAG67955, AAG67955, AAG67956, AAG67957, AAG67958, AAG67967, AAG67967, AAG67968, AAG67968, AAG67968, AAG67968, AAG67968, AAG67969, AAG67969, AAG67969, AAG67969, AAG67969, AAG67969, AAG67969, AAG67971, AAG67972, AAG67973, AAG67974, AAG67975.

into a host cell and culturing the cell to express the protein. The gene and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The protein may also be used as antigens in the production of antibodies against neuregulin 1 and in assays to identify modulators of neuregulin 1 expression and activity. The antibodies and antagonists may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of neuregulin 1 in samples.

Novel purified corn-ear derived polynucleotide useful as hybridization probe for detecting polynucleotide in sample, and for identifying, evaluating, and altering desired characteristics associated with development

WPI; 2003-208840/20.

Examples; SEQ ID No 613; 390pp; English.

The present invention relates to the isolation of corn ear-derived polynucleotides (cdps) from the corn (Zea mays) cDNA libraries SATMON023 and SATMON023. Some of the cpds uniquely identify structural, functional, and regulatory genes of corn ear. The polynucleotides sequences are useful for detecting cpds in a sample, for producing a corn ear-specific profile of gene transcription, for detecting altered gene expression in inbred or hybrid plants, and for screening several molecules for specific binding to the polynucleotide. The cdps are useful to identify, isolate, or extend identical or related corn-ear nucleic acid sequences from DNA libraries, nucleic

Preferably, the cdps are used to identify, evaluate, alter, or follow the inheritance of desired characteristics associated with growth and development, disease resistance, environmental adaptability, quality, and yield of corn. The cdps are also useful as molecular markers for studying inheritance and multigene traits in a plant breeding program. The cpds are useful for producing purified corn-ear polypeptides by recombinant techniques. They are also useful in diagnostic assays to detect or confirm conditions or diseases associated with abnormal levels of cdp expression. ABX81541-ABX89140 represent corn ear-derived polynucleotides (cpds) of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
The present sequence describes a purified corn tassel-derived polynucleotide sequence (cdps) comprising a nucleic acid sequence pellynucleotide sequence (cdps). To ABL76833. The cdps sequences encode corn tassel-derived polypeptides (CDPs). The cdps sequences (I) can be used for determining altered gene expression, to recover regulatory elements and to follow inheritance of desirable
                                                                                                                                                                                                                                                                                                                                      Novel purified corn tassel-derived polynuclectide useful for determining altered gene expression, to recover regulatory elements and to follow inheritance of desirable characteristics through hybrid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABL72764 standard; cDNA; 289 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 288 BP; 55

Sequence 6599, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
FILLE OF INVENTION: NUCLERC ACID AND AMINO ACID SEQUENCES RELATING:
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NO.6599
LENGTH: 510
TYPE: DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PRIOR APPLICATION NUMBER: US 60/074,788
